DETAILED ACTION

The amendment filed on April 26, 2005 has been entered. By this amendment, claims 2-6 have been added, and claims 1-6 are now pending in the application.

Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sasaki et al (US 6,246,961) (enclosed IDS).

As per claim 1, Sasaki teaches a time to contact estimate determination system. The system comprises: an image receiver for receiving image information relating to a series of at least two images (col.3, lines 23-30); a processor 2-3 (fig.1) for determining a time to contact estimate of the vehicle (col.6, lines 15-25). Sasaki does not explicitly disclose determining a scaling factor that defines a ratio between dimensions of the obstacle. However, Sasaki teaches equation (6) in which the ratio between the dimension x in equation (6) and the Δx (the change in the dimension x obtained from the dimension x of the first image and the dimension x' of the second image) contained in parameter $u = \Delta x / \Delta t$ (col.5, line 28; line 39 (equation 6)), the result

of the ratio Z is used to determine the time of contact (col.6, lines 18-25), therefore Sasaki obviously encompasses teaching determining the ratio of the dimensions of the images in order to determine the time to contact.

As per claim 2-3, Sasaki teaches determining horizontal and vertical optical flow (col.5, lines 44-49). Since the horizontal and vertical optical flows include equation (6) which includes ratio of the dimensions, the ratio obviously encompasses horizontal and vertical dimensions.

As per claim 4, including more than 2 images in determining time to contact would have been both well known and obvious matter of design choice.

As per claim 5, Sasaki teaches determining displacement in lateral direction x (col.5, lines 52-65).

As per claim 6, Sasaki teaches determining a likelihood of collision when the lateral displacement and the axis Z is zero (col.6, lines 1-25).

Response to Arguments

3. Applicant's arguments have been considered but are moot in view of the new grounds of rejection.

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.
